

How a Tier 1 Hedge Fund Trading Team Utilises BMLL & INQDATA to Generate & Manage Trading Analytics

Problem

An Event-Driven Trading Team within a Tier 1 Systematic Hedge Fund wanted to generate, evaluate and onboard a suite of analytics it could use to inform its trading strategy. However, the team faced significant bottlenecks. Without internal resources, onboarding new datasets would take 9 months before generating the required analytics.

Solution

INQDATA enabled access to BMLL datasets within two weeks in kdb+, enriching the dataset for immediate use without delays. Multiple users were able to explore and validate the datasets seamlessly. This empowered the client to run testing and derive value without resource overhead, sunk costs, or disrupting existing workflows.

Benefits

INQDATA's cloud-native, fully managed service and BMLL's high-quality normalised historical data enhanced the client's existing workflows by removing the burden of additional data engineering required to trial, onboard and generate analytics from datasets. This freed up internal resources to focus on business-facing deliverables and value-added initiatives.
